## 自平衡泵，十大优势

### 新结构

具有叶轮对称布置的转子部件，使正、反两组叶轮在运行中产生的轴向推力基本得到相互抵消，从而不需要小间隙、高压降、易冲刷、易磨损、易出故障的平衡盘装置来维持轴向力的平衡，突破了多级泵的传统结构。

### 新技术

独有的节流、减压装置、奇数级的平衡装置。还能起到辅助支承的作用。

### 高效节能

采用先进的水力模型，自主研发的高效节能的产品；由于泵转子没有了平衡盘的磨损及轴向脉动，叶轮与导叶的对中性总是处于最佳状态，不会像普通多级泵结构随平衡盘的磨损、转子部件前移而出现效率明显下降；且没有了平衡水的泄露，减少了容积损失，在整体上提高了泵的运行效率，比普通多级泵效率平均高2%~3%

### 高可靠性

自相平衡的轴向力载荷使泵的磨损和系统干扰降到最小。极小部分残余轴向力由推力轴承承受，这样使泵轴始终处于受拉状态、轴的受力状态均匀，且应力峰值较原型结构大大降低，从而提高了泵转子的刚性和临界转速，使泵转子运行的平稳性和可靠性显著提高。

### 高稳定性

通过对称叶轮和导叶的最佳配备，以及合理的配合间隙和较宽的轴向节流设计，使泵在长期运行后仍然能保持其高度的稳定性和极高的运行效率。

### 汽蚀性能好

优化的水力模型及结构设计、特殊的首级叶轮双吸结构，加上精密的铸造、可靠的耐磨材质，使泵具有良好的抗气蚀性能，整机运转平稳、噪音低，用户无需另外配置前置泵或提高进水箱的高度。

### 机封强可靠性

泵启、停时转子部件没有轴向窜动，工作时没有轴向脉动，克服了一直困扰多级泵的机封可靠性差这一难题。

### 检修方便

快速的装配和拆卸设计，允许水泵在不拆卸泵体和进、出口管路的情况下更换密封、轴承，泵内没有了平衡盘等易损部件，节省了大修和检查时间。

### 低维护率

采用精密铸造，减少了易损部件以及维修拆装次数，延长了产品寿命，并最大限度地避免了由于拆装过多引起的一系列问题，降低了维护成本。

### 适用性强

先进的组合模块化的设计，经过大量使用、长期运行考验的局部组件，零部件具有高度的可互换性。  
取消了小间隙平衡盘装置，比传统结构多级泵适应于介质性质更为恶劣的场合。

## ADVANTAGES OF SELF-BALANCING PUMP

### New Structure

The rotor components which have the structural feature of Symmetrical set impeller, which could counter balance the axial thrust generated by the forward impeller and backward impeller, which make the balance disc useless and break the traditional structure of the multi stage centrifugal pump.

### New Design

With unique throttling and pressure releasing component, the odd balance component which also have the function of auxiliary support.

### High Efficiency

Adopted advanced hydraulic model and with unique structural design, centering of the impeller and diffuser always in perfect state after the abandoning of balance disc since it will cause wearing & tearing to the pump components and axial pulsation of related parts, which greatly increased the pump efficiency and reduced the shaft power.

### Stationary & Low Vibration

Self-balanced axial force can reduce the wearing & tearing of the pump components and assure the pump in good state. The remanent axial force will be carried by the thrust bearing which will make the pump shaft in equally tension state, and it will reduce peak stress and increase the rigidity and critical speed of rotation, which makes the rotor more stable and low vibration.

### High Stability

With the Symmetrical set impeller and diffuser structure, proper tolerance clearance and widen axial throttling design, the pump could remain in high stability and efficiency after long period of running.

### Good Cavitation Performance

Optimized hydraulic model and unique dual suction of the forward impeller which casting with wear resistant material precisely, the pump have good cavitation performance and low noise, users would not need to equip extra boost pump or elevate the height of the inlet chamber.

### Reliable Mechanical Seals

No axial movements of the rotor parts while starting-up and stop the pump, no axial pulsation when the pump running, it almost settled the problem of low reliability of the mechanical seals which always existed in the multi stage centrifugal pump.

### Easy Maintenance

Since the easy installation and disassembly design, the inside components like the bearing, seals could be replaced without disassembly the whole pump and the inlet & outlet pipeline system, meanwhile, after the abandoning some of the easy wearing components like the balance disc, it has greatly shorten the time of checking and repairing.

### Low Failure Ratio

All parts and accessories with precise casting, which greatly reduced the possibilities of maintenance and repairing of the wearing parts, and avoid possible damaging while the installation and disassembly of the pump.

### Parts sharable & Wide range of application

Advanced module design, each part and component gone through long term and heavy testing, and the parts & components could be sharable among the total four series. Meanwhile, the abandoning of the balance disc makes the pump could be applied to a wide range of site conditions after change the flow passage parts.

## 产品概述

ZPD、ZPDF、ZPDY、ZPMD系列卧式多级离心泵(自平衡型)，分为单吸多级结构和双吸多级结构。该系列产品是为加速多级离心泵技术发展，并满足用户需求，在吸收消化国外先进技术的基础上，结合本公司多年研发经验设计的创新产品，产品性能达到业内同类产品的先进水平，是普通多级离心泵最好的替代品。

该型泵典型特点表现于在结构上彻底取消传统的用于平衡轴向力的平衡盘系统，依靠叶轮对称布置自动平衡轴向力，这一创新使得多级泵运行具节能高效、平稳可靠、易损件少、运行成本大大降低等优势。

## 型号意义

如 ZPD (DF、DY、MD) S 280-95 x 13

D —— 表示卧式多级清水离心泵  
DF —— 表示矿用耐腐卧式多级离心泵  
DY —— 表示卧式多级离心油泵  
MD —— 表示矿用耐磨卧式多级离心泵  
S —— 表示首级叶轮为双吸结构  
280 —— 表示设计点流量为280m<sup>3</sup> / h  
95 —— 表示设计点单级扬程为95m  
13 —— 表示泵级数为13级  
ZP —— 表示自平衡型

## 性能范围

ZPD、ZPDF、ZPDY、ZPMD型泵具有相同的性能参数

泵吸入、排出口径 40~350mm  
流量Q = 3.75 ~ 1360m<sup>3</sup> / h  
扬程H = 92 ~ 1384m  
电机功率N = 7.5 ~ 4000kW

(注：本册中所列性能参数值为常温清水状态值。)

## 应用范围

可供输送不含固体颗粒（磨料）、不含悬浮物的清水或物理化学性质类似于清水的其它液体之用。也可通过改变泵的材质（或泵过流部件的材质）、密封形式和增加冷却系统用于输送热水、油类、腐蚀性或含磨料的介质等。

泵允许进口压力不大于0.6MPa。

### ZPD型

用于输送不含固体颗粒、温度低于80°C的清水或物理化学性质类似于清水的液体。适合于矿山、工厂和城市给排水工程之用。

### ZPDF型

用于输送不含固体颗粒、温度低于105°C的腐蚀性液体，泵进口允许压力小于0.6MPa。用户可根据输送介质的名称、浓度、比重、使用温度及泵进口压力等合理选用泵的材质、密封形式、泵的结构和确定电机的容量等。

### ZPDY型

用于输送不含固体颗粒、温度低于105°C、粘度小于120厘泊的油类和石油产品。

### ZPMD型

用于输送颗粒含量≤1.5%，粒度≤1.3mm，温度低于80°C的中性矿井水及其他类似的污水。

## General Description

This series of horizontal multistage centrifugal pump (self-balancing function) can be divided into single-suction structure and double-suction structure. This series of products greatly accelerated the technology development of multi-stage centrifugal pump and met user's demands. On the basis of absorbing oversea advanced technology and combination of our own innovative design which with many years' R&D experience, the product performance reached the advanced rank of similarly products.

Main features of this series of pump is that it removed the balancing disc system which is traditional used to balance axial thrust force in structure and rely on impeller is symmetric assignment to balance the axial force automatically instead. This innovative design makes the multi-stage pump with the advantages of high efficiency & energy saving, stable and reliable performance, less consumable parts & greatly reducing operating costs etc.

## Instruction of Model

For example: ZPD(DF\DY\MD) S280-95 x 13

D--Horizontal multi-stage centrifugal clean water pump  
DF-- Corrosion-resistance horizontal multi-stage centrifugal pump  
DY--Horizontal multi-stage centrifugal oil pump  
MD--Abrasion-resistance horizontal multi-stage centrifugal pump  
S--Forward impeller design in double-suction structure  
280--Rate flow is 280 m<sup>3</sup>/h  
95--Rate delivery head is 95m by single stage  
13-- 13 stages  
ZP--Self-balancing function

## 执行标准

GB/T5657-1995 《离心泵技术条件(III类)》  
JB/T1051-2006 《多级清水离心泵型式及基本参数》  
GB/T3216-2005 《回转动力泵水力性能验收试验1级和2级》  
MT/T 114-2005 《煤矿用多级离心泵》

## Performance Range

ZPD\ZPDF\ZPDY\ZPMDseries pump share the same performance range

Pump suction, discharge diameter 40~350mm  
Flow Capacity (Q)=3.75~1360m<sup>3</sup>/h  
Delivery Head (H)=92~1384M  
Motor Power(N)=7.5~4000KW

(Remarks: Performance parameters listed in this brochure are based on normal ambient temperature)

## Application Range

The pump is widely used to deliver water without solid particles and suspended matters, or other liquid similarly. It could deliver hot water, oil, corrosive liquid by change the material of flow passage parts.

The max inlet pressure should not exceed 0.6MPa.

### ZPD series

Used to deliver clean water or similar liquid without solid particle and the liquid temperature is below 80°C. It is widely used in mines, factories, urban water supply and drainage system.

### ZPDF series

Used to deliver corrosive liquids without solid particles and the liquid temperature is below 80°C. Users may choose the pump's material, sealing mode, pump structure and motor power according to the liquid by its PH value, density, gravity, temperature and the working pressure.

### ZPDY series

Used to deliver oils and petroleum products without solid particles, the liquid temperature is below 80 °C and its viscosity is less than 120cP.

### ZPMD series

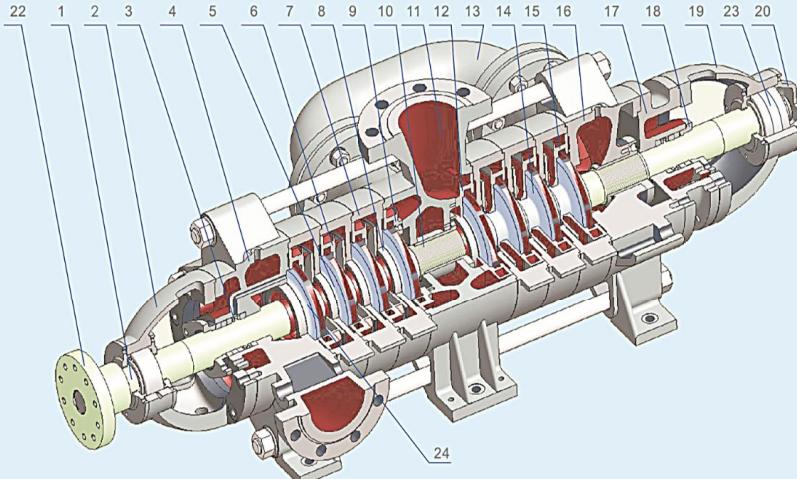

Used to deliver neutral water or similar liquid with solid particles, and the particle contents less than 1.5%, particle diameter less than 1.3mm, and the liquid temperature is below 80 °C.

## Products Standard

GB/T5657-1995  
<< Technical conditions for Centrifugal water Pump (III) >>  
JB/T1051-2006  
<< Type and basic parameter of multi stage water pump>>  
GB/T3216-2005  
<< Hydraulic performance testing of rotating pump I & II >>  
MT/T 114-2005  
<< Multi stage centrifugal pump for coal mining >>

## 结构特点

ZPD, ZPDF, ZPDY, ZPMD型泵系卧式自平衡型结构多级离心泵，按吸入形式分为单吸多级结构和双吸多级结构。其吸入口在进水段为水平方向，吐出口在出水段上垂直向上，用拉紧螺栓将泵的进水段、中段、出水段、次级进水段联成一体，扬程高低可增减泵的级数。

- ◆ 水泵的主要零件：进水段、中段、出水段、次级进水泵、正导叶、反导叶、正叶轮、反叶轮、轴、节流减压装置，挡套、轴承体、过滤管等；
- ◆ 转子由装在轴上的正叶轮、节流减压装置、反叶轮、轴套、轴承挡套等零件组成；轴承采用“固-游式”干油润滑结构，驱动端采用圆柱滚子轴承，末端采用圆柱滚子轴承与角接触球轴承的组合结构；
- ◆ 泵的进水段、中段、出水段之间的密封面均采用密封胶或O型圈密封，转子部分与固定部分之间装有密封环、导叶套等进行密封，当密封环和导叶套的磨损程度已影响泵的工作性能时应及时予以更换；
- ◆ 轴的密封形式有机械密封和填料密封两种。泵采用填料密封时，填料环的位置安装要正确，填料的松紧程度必须适当，以液体能一滴一滴渗出为宜。泵各种密封元件装在密封腔内，腔内要通入一定压力的水，起水封、水冷或水润滑作用。用轴封处装有可更换的轴套，以保护泵轴；
- ◆ 该系列泵通过弹性联轴器由原动机直接驱动。从原动机方向看，泵为顺时针方向旋转。

(电机常规配置为Y系列电机，在有可燃易爆气体的场合采用YB/YB2系列防爆电机。)

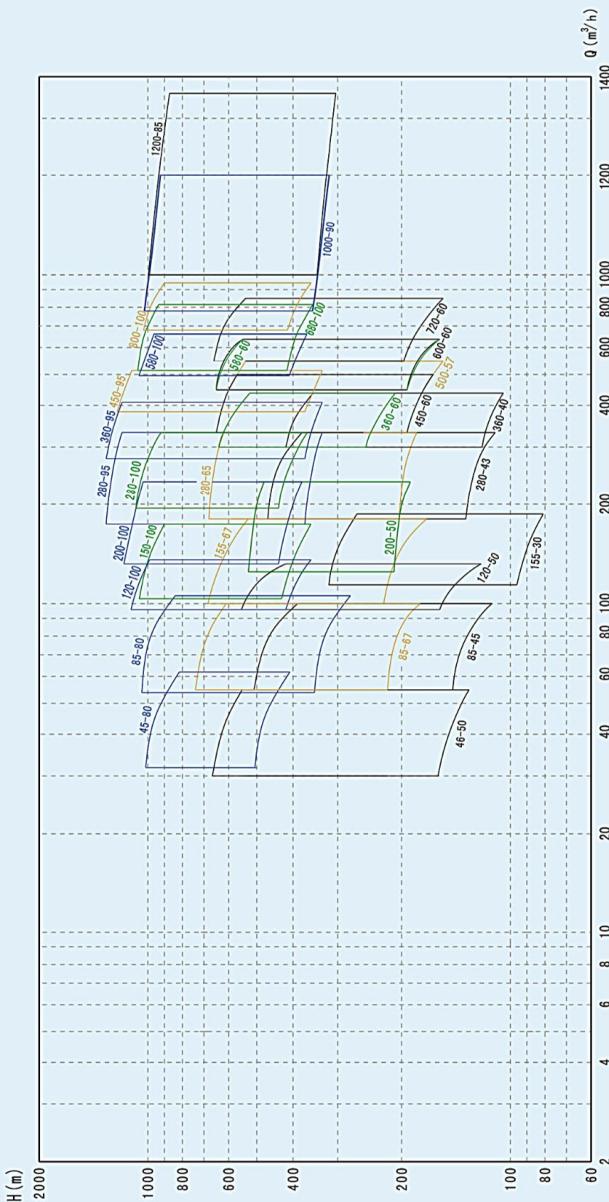

## Structure Features

ZPD, ZPDF, ZPDY, ZPMD pumps are horizontal multi stage self-balanced centrifugal pump, it can be divided into single-suction multi-stage structure and double-suction multi-stage structure according to the form of suction. The inlet suction is in horizontal direction and the outlet discharge. Its suction nozzle at suction-stage is in horizontal is vertical upward. The pump suction-stage, Middle-stage, Discharge-stage and secondary suction-stage all connected with outward bolt and the delivery head may adjust according to the pump stages.

- ◆ Main parts of the pump: Suction-stage, Middle-stage, Discharge-stage, Secondary suction-stage, forward guide vane, backward guide vane, Impeller, backward guide impeller, Shaft, Throttling & Pressure reducing devices, space sleeve, Bearing, Filter tube, etc.
- ◆ The pump rotors consist of impeller which installed on shaft, Throttling pressure-reducing device, backward impeller, shaft sleeve, bearing sleeve etc. The bearing adopts "fix-floating-form" grease oil lubrication structure, the drive side use cylindrical roller bearings, the end use combination structure of cylindrical roller bearings and angular contact ball bearing.
- ◆ The sealing surface among suction-stage, middle-stage, and discharge-stage use sealant or O-ring to do the sealing. The rotator parts and the fixed parts use sealing ring and diffuser sleeve etc. to do the sealing. Replacement of sealing ring and diffuser sleeve when its degree of wear affects the pump's working performance.
- ◆ There are two types of shaft sealing: mechanical sealing and packing sealing. When using packing sealing, the packing ring must install in correct position and proper tightness to make sure the packing liquid can exude drop by drop. The various sealing elements of pump in stallin the sealing cavity which passing into water with certain pressure for water sealing, water-cooling or water lubrication purposes. The shaft sealing part equipped with replaceable shaft sleeve to protect the shaft;
- ◆ This series pump driven by a motor which connected to pump by a flexible coupling. View from the mover to the pump, the pump's rotating in clockwise.

(usually equipped with Y series motor, YB/YB2 will be available while the pump applied to flammable and explosive site conditions)

## 装配与拆卸

泵装配质量的好坏直接影响泵能否正常运行，并影响泵的使用寿命和性能参数及机组的振动和噪音，装配中须特别注意。

### ● 装配前的准备

- ◆ 泵在装配前首先检查零件有无影响装配的缺陷，并擦洗干净，方可进行装配。
- ◆ 检查各处的配合是否合适。

### ● 泵的装配

- ◆ 应保护好零件的加工精度和表面粗糙度，不允许有碰伤、划伤等现象，作密封用的密封胶要干净，紧固螺钉和螺栓应受力均匀；
- ◆ 叶轮出口流道与导叶进口流道的对中性是依各零件的轴向尺寸来保证，流道对中性的好坏直接影响泵的性能，故泵的尺寸不能随意调整。
- ◆ 泵装配完毕后，在未装填料前，用手转动泵转子，检查转子在泵中旋转是否灵活；
- ◆ 检查合格后压入填料，并注意填料环在填料腔的相对位置。

### ● 泵拆卸时应注意的事项

- ◆ 按停车顺序停车；
- ◆ 泵壳内液体（包括冷却水）应放掉；轴承部件是稀油润滑时，应放掉润滑油；
- ◆ 拆去妨碍拆卸的附属管路，如回水管等；
- ◆ 拆卸时应严格保护零件的制造精度不受损伤，拆卸穿杆的同时应将各中段用垫块垫起，以免各中段止口松动下沉将轴压弯。

### ● 泵的拆卸顺序

- ◆ 卸下泵联轴器后，拧下轴承压盖上的螺栓、进水段和轴承体的联接螺母后，卸下前轴承体；
- ◆ 拧下轴上圆螺母并依次卸下轴承内圈、轴承压盖和挡圈；
- ◆ 将各中段用垫块垫起，卸下穿杆螺母，卸下进水段，及进水段上的填料压盖、填料环、填料等；
- ◆ 依次卸下前级叶轮，平键、正导叶，正叶轮，末级正导叶，出水段，中节流、减压装置；
- ◆ 依次卸下末级反导叶，末级反叶轮，平键、反导叶，反叶轮，后节流、减压装置，千万注意正、反叶轮，导叶的方向和顺序；
- ◆ 拧下次级进水段、尾盖之间的螺母，将主轴，尾盖、后轴承体部件取去；
- ◆ 拧下尾盖、轴承体之间的螺母，卸下尾盖上的填料压盖、填料环、填料等；
- ◆ 拧下后轴承压盖上的螺栓，将轴承，小圆螺母，轴承盖依次卸下；
- ◆ 采用滑动轴承的泵，其拆卸顺序基本相同，仅在拆卸轴承部件时略有不同。

## 泵的安装

本型泵安装时除满足一般要求外，还应注意以下几点：

- ◆ 安装泵的基础平面应用水平仪找平，基础水泥凝固后，应检查底座和地脚螺栓孔是否松动；
- ◆ 电机、泵和底座组装后，应严格检查泵轴和电机轴的同心度，保证两轴心线在同一水平线上；
- ◆ 电机和水泵组装时，保证泵和电机两联轴器端面的轴向间隙值，该系列泵无轴向窜动；
- ◆ 泵只能承受自身内力，不能承受任何外力，所以泵的吸入管路和压出管路应有各自的支架，以免将泵压坏。
- ◆ 用于含有可燃易爆气体的矿井下运行的ZPD、ZPMD型泵，必须采用防爆电机并要求具有相应的防护等级和防爆标志。⚠

## Installation & Disassembly

Please pay attention to the pump assembly which will directly affect the pump's normal operation, usage life, performance and the vibration & noise level!

### ● Preparation Before Assembly

- ◆ TO check all the parts to avoid any defect, clean up all the parts before assembly.
- ◆ TO check all parts for any scratches and surface roughness.

### ● The Pump Assembly

- ◆ Ensure the parts' machining accuracy and surface roughness without crack, scratches etc, the sealant for sealing purpose should keep clean and make sure to keep the screws and bolts under average stress;
- ◆ The centering of impeller outlet channel and diffuser inlet flow channel depend on the axial dimension of each part, the flow passage centering will affect the pump performance directly, so the pump size should not be changed at random;
- ◆ After the assembly, rotating the pump rotor by hands before filling with packing seal to check the flexibility of rotor ;
- ◆ Fulfill the packing seal chamber after the above checking and pay attention to the position of the sealing ring in the relative position of the packing chamber.

### ● Disassembly Notice

- ◆ The pump stopping should strictly follow the instructions
- ◆ Draining off the liquid inside pump (including the cooling water), and also draining off the lubricating oil when the bearings were lubricated by diluted oil;
- ◆ TO remove the subsidiary pipeline which obstructing the disassembly
- ◆ Keep all the parts strictly away from damage in disassembly. When removing the wear rod, every middle part should be held by cushion to prevent the shaft bending by the sink of each middle part.

### ● Disassembly Sequence Of The Pump

- ◆ After removing the pump coupling, unscrew the bolts of bearing cover and coupling nut of suction-stage and bearing housing, then removing the front bearing;
- ◆ Unscrew the round nut on the shaft and remove the bearing inner ring, bearing cover and the fixed ring in order.
- ◆ Underlay each middle stage, remove wear rod nuts, suction-stage and packing gland, packing ring, packing seals on the suction-stage;
- ◆ Remove the front stage impeller, flat key, forward guide vane, backward guide vane, discharge-stage, throttling & Pressure reducing device one by one.
- ◆ Remove the backward reverse guide vane, backward reverse impeller, flat key, backward reverse impeller, backward reverse guide vane, rear throttle and pressure relief device in order. Please notice the sequence and the directions of impellers and guide vane.
- ◆ Unscrew the nuts between secondary suction stage and end cover, and then take down shaft, end cover and back bearing parts.
- ◆ Unscrew the nuts between end cover and bearing, and remove the packing gland, packing ring and packing seals etc.
- ◆ Unscrew the bolts on the rear bearing caps, and take down the bearings, small round nut, bearing caps one by one in sequence;
- ◆ The pump with sliding bearing can take the same disassemble sequence, only slight difference when removing the bearing parts.

## Pump Installation

Additional points are advised apart from general requirements:

- ◆ Horizontal instrument is advised for installation foundation. Assure the foundation bolts are tight sufficiently into the foundation.
- ◆ Concentricity of shafts of pump and motor shall be checked strictly to make sure that these two shafts are on the same line after assembly of motor, pump and foundation.
- ◆ When installing motor and pump, ensure the axial gap between the coupling pump, and also the axial gap between the coupling and motor, since this series of pump are without axial movement;
- ◆ Independent brackets for inlet pipelines and discharging pipelines are necessary in that the pump can sustain its own stress only This avoids possible damage to the pump from external pressure.
- ◆ Explosive-proof motor is a must for ZPD and ZPMD pump under circumstances of inflammable and explosive, mining well for instance, while insulation class and explosive-proof mark shall be indicated.⚠

## 泵的起动、运行和停机

### ● 起动

- ◆ 泵起动前应转动泵转子，检查转子是否灵活；
- ◆ 检查电机转向是否与泵转向一致；
- ◆ 打开泵吸入阀（如果装有吸入阀时），关闭泵出口管路闸阀及压力表旋塞，使泵内充满液体，或用真空系统排除吸入管路和泵内空气；
- ◆ 检查泵和电机联接螺栓的松紧程度和泵周围的安全情况，使泵处于准备起动状态；
- ◆ 起动电机，待泵运转正常后，打开压力表旋塞，慢慢开启泵出口闸阀，直到压力表指针指到所需压力为止（按出口压力表读数控制泵给定的扬程）。

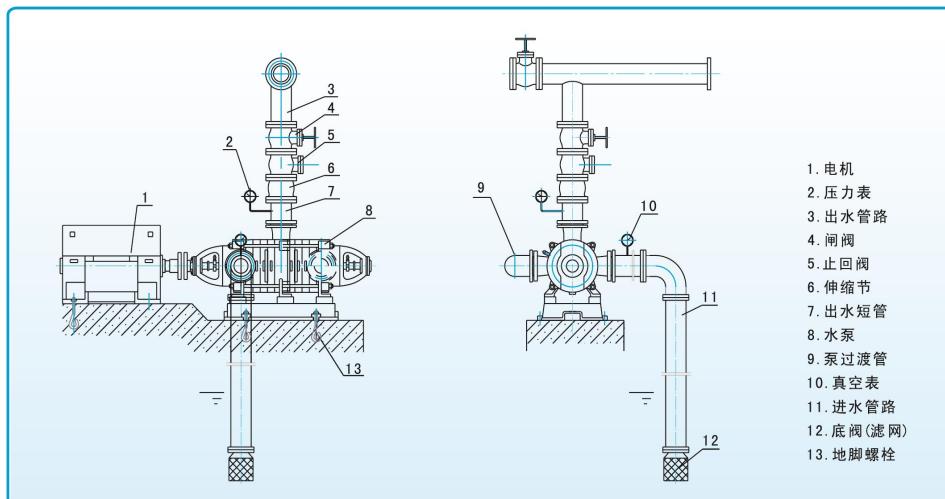

### ● 运行

- ◆ 该泵轴向力靠泵自身平衡，故无平衡水管；为保证泵正常运行，回水管不允许堵塞；
- ◆ 在起动和运行过程中，必须注意观察仪表读数、轴承发热、填料漏水和温度、泵的振动和声音等是否正常，如发现异常情况，应及时处理；
- ◆ 轴承温升变化反映了泵的装配质量，轴承温升不得高于环境温度35℃，轴承的最高温度不得高于75℃；
- ◆ 泵在运行期间应定期检查叶轮、密封环、导叶套、轴套、节流、减压装置等零件的磨损情况，磨损过大应及时更换。

### ● 停机

- ◆ 停机前应先关闭压力表旋塞，慢慢关闭出口闸阀，待出口阀关闭完毕后再停电机，泵停稳后再关闭泵的吸入阀（如果装有吸入阀时）；
- ◆ 如泵长期停用，应将泵的进水段，出水段，次级进水段下方放水螺塞全部卸下，放掉余水，并将泵拆卸清洗上油，包装保管。

## 泵管路安装示意图

## Start-up, Operating And Halting Of Pump

### ● Start-up

- ◆ Rotate the rotor of the pump to make sure it is flexible;
- ◆ Check and assure the rotation direction of the motor and the pump is identical
- ◆ Open the suction valve, if available and close the gate valve of outlet pipelines and faucet of the pressure meter to fill the pump with liquid; Or use vacuum to expel all air out of the pump and pipelines.
- ◆ Make the pump ready for initializing after qualification of tightness of bolts between the pump and the motor and surroundings of the pump.
- ◆ Open the faucet of the pressure meter after normal operation of the pump and open the gate valve slowly till pointer of the pressure meter to the right value. (Control the head of the pump according to the discharging pressure)

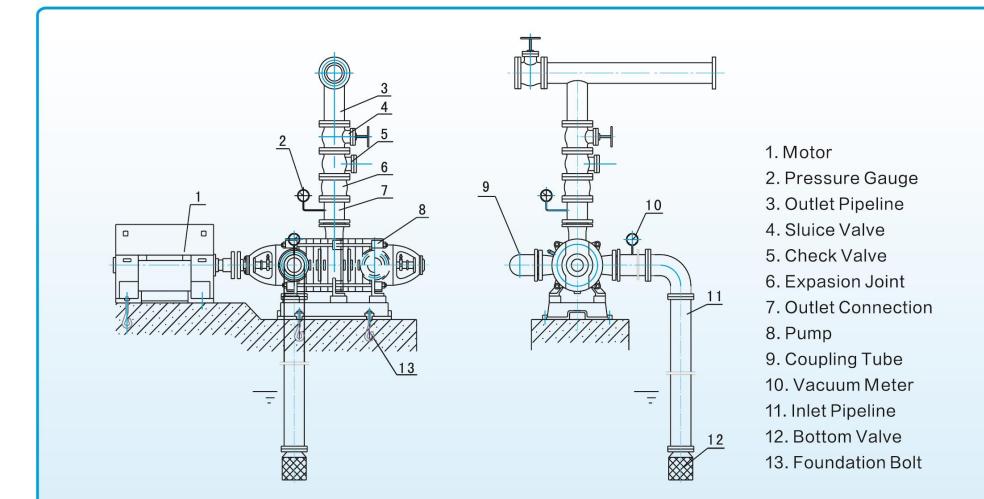

### ● Operating

- ◆ Axial force is balanced by balancing system inside the pump in which equipped none balancing water pipe; water return pipe is not allowed to be blocked to keep normal operation of the pump.
- ◆ Attention shall be made for all meters, temperature of bearing, leakage of filling, vibration and noise of the pump and immediate action shall be made if anything happens as following.
- ◆ Temperature rise of bearing reflects assembly quality of the pump; Temperature shall not be 35. C higher than that of ambient while the max temperature of the bearing is 75C
- ◆ Axial movement of the rotor of the pump is possible and shall be within allowable range Gad width between end surface of the coupling joints of the motor and the pump.
- ◆ Impeller, sealing ring, guide vane, shaft sleeve and balancing plate shall be checked regularly during operation and immediate replacement shall be made if any wearing parts found.

### ● Halting

- ◆ Close the faucet of the pressure meter and close the discharging gate valve slowly; Halt the motor till discharging valve is totally closed; Close the suction valve, if any, after halting of the pump.
- ◆ For long time halting of the pump, all water shall be discharged by means of opening of all faucets of inlet segments, the middle, and the discharging; Disassemble the pump and oil all parts for long time keeping.

## Pipeline Installation Diagram

## 泵常见故障分析与排除方法

故障现象	原因分析	排除方法
泵不吸水，压力表、真空表指针剧烈震动，或真空表显示高度真空	1. 泵充气不够 2. 吸水管或表漏气 3. 底阀未开 4. 吸水管堵塞 5. 吸水高度过大	1. 注水放气 2. 上紧螺扣 3. 修理或更换底阀 4. 清洗吸水管 5. 降低吸水高度
压力表有压力，但不出水或流量过小	1. 流道有堵塞，或底阀局部堵塞 2. 泵转速低于规定值 3. 系统总扬程高于泵设计扬程 4. 泵中进入气体 5. 泵转向不对 6. 零件磨损，内部泄漏过大	1. 清洗流道，或清除底阀异物 2. 提高泵转速 3. 增加泵级数或减少管路损失 4. 堵塞进气部位 5. 电机重新接线 6. 更换磨损零件
电机电流过大	1. 系统总扬程大大低于泵的设计扬程 2. 管路破裂跑水 3. 启动时未关闭出口闸阀 4. 泵轴与电机轴不同心 5. 旋转件与固定件发生摩擦 6. 轴承磨损 7. 转子不平衡，产生振动 8. 电压过低	1. 关闭闸阀进行调节，或减少泵级数 2. 停泵处理管路 3. 关闭闸阀，重新启动 4. 重新找正，避免系统力作用于泵上 5. 拆泵重新调整 6. 更换轴承 7. 拆卸转子做静平衡、动平衡检测 8. 提高电压
填料函泄漏多，填料发热冒烟，填料寿命短	1. 泵轴与电机轴不同心 2. 轴发生弯曲 3. 填料处轴套损伤，或填料安装不当，或填料型号不对 4. 填料与轴套间有杂质	1. 重新找正 2. 拆卸、矫正轴 3. 打磨或更换轴套，或重新安装填料、均匀压紧或更换填料 4. 更换填料
泵震动或有噪音	1. 泵发生汽蚀 2. 流道有堵塞，或底阀局部堵塞 3. 管路破裂跑水 4. 出口阀打开启动 5. 泵与电机轴不同心，或轴弯曲 6. 基础刚性不足 7. 旋转件与固定件发生摩擦 8. 叶轮缺损 9. 轴承内润滑油脂过多或过少 10. 轴承磨损或内存脏物	1. 降低泵的几何安装高度，减少吸水管阻力 2. 清理流道，或清理底阀 3. 停泵处理管路 4. 关闭闸阀，重新启动 5. 重新找正，或检修、换轴 6. 加固基础 7. 拆卸、重新调整泵 8. 更换叶轮 9. 添加润滑油脂要适量 10. 更换或清洗轴承，并注意密封轴承
轴承发热	1. 泵轴和电机轴不同心，或轴弯曲 2. 旋转件与固定件摩擦 3. 轴承损坏，或轴承内存脏物或进水 4. 轴承内润滑油脂过多或过少	1. 重新找正，或检修、换轴 2. 拆卸、重新调整泵 3. 添加润滑油脂要适量 4. 更换或清洗轴承，并注意密封轴承
中段等处结合面漏液	1. 穿杠螺栓紧固力不够或用力不均 2. 零件的制造精度（粗糙度，跳动或垂直度）未达到设计要求，或残余应力使零件变形 3. 结合面不洁或损坏	1. 重新紧固穿杠螺栓 2. 拆泵检查 3. 检修结合面

## Trouble & Solutions

Failures	Causes	Solution
Water sucking failure Pointer of pressure Meter and vacuum meter Moves severely Vacuum meter indicate Extremely high of vacuum	1. Insufficient perfusion 2. Leaking of the suction pipeline or the Measure meter 3. Bottom valve closed 4. Suction pipeline blocked 5. Over height of water sucking	1. Re-perfusion and relieve the air 2. Tighten and seal all the screws and connections 3. Repair or replace the bottom valve 4. Clean the suction pipeline 5. Reduce the height of water sucking
Pressure meter indicates Rightly but discharging Fails	1. Flow path blocked or bottom valve is Partly blocked 2. Pump running under low speed or wrong direction 3. Air leakage into the pump or pump parts damaged 4. The whole delivery distance exceed the design capacity	1. Clean the flow path and bottom valve 2. Enhance the pump speed or adjust the rotating Direction of the impeller 3. Make sure the pump in none air leakage states 4. Increase impellers and reduce the pipeline loss
Currency overflow	1.the whole delivery distance exceed the Design capacity 2. The pipeline leakage 3. Sluice valve not closed when starting up 4. The centering of the pump shaft and motor shaft not in the same level 5. Friction occurred between the rotating Parts and fixed part 6. Bearing wear 7. Rotor not balanced 8. Low voltage of power supply	1. Close the sluice valve, and reduce the pump stages 2. Repair the pipeline system 3. Close the sluice valve and re-start the pump 4. Centering again 5. Disassemble the pump for re-adjustment 6. Change the bearing 7. Disassemble the pump and re-adjust the dynamic and stationary balancing 8. Increase the voltage of power supply
Packing seal over Leaking Packing seal over Heat Packing seal over Consumption	1. The centering of the pump shaft and Motor shaft not in the same level 2. Shaft bent 3. Shaft sleeve broken, packing seal not Right or not fixed in right position 4. Impurities fill between the packing seal And shaft sleeve	1. Centering again 2. Adjust the shaft 3. Polish or replace the shaft sleeve, refill or replace The packing seal 4. Replace the packing seal
Pump vibration & Noise abnormal	1. Pump cavitation 2. Flow path blocked or bottom valve is partly blocked 3. The pipeline leakage 4. Outlet valve not close while starting the pump 5. The centering of the pump shaft and motor shaft not in the same level, or the shaft get bent 6. The foundationlack of rigidity 7. Friction occurred between the rotating parts and fixed part 8. Impeller damaged 9. Lubricating oil in the bearing is too much or too little 10. Bearing wear down or impurity	1. Reduce the installation height of the pump 2. Clean the flow passage and the bottom valve 3. Clean the pipeline 4. Close the sluice valve and restarting the pump 5. Centering again 6. Enhance the foundation 7. Adjust the pump and reassemble the pump 8. Replace the impeller 9. Fulfill the lubricating oil or reduce it to the right Volume 10. Clean the bearing
Bearing over heat	1. The centering of the pump shaft and motor shaft not in the same level, or the shaft get bent 2. Friction occurred between the rotating parts and fixed part 3. Bearing wear down or impurity 4. Lubricating oil in the bearing is too much or too little	1. Centering again 2. Adjust the pump and reassemble the pump 3. Replace the bearing or clean the bearing 4. Adjust the lubricating oil
Leakage from juncture Between stages	1. Outward bolt loosen 2. Surface of the stages not accurate and Smooth or damaged	1. Tighten the outward bolt 2. Check the stage surface, repair or replace the Damaged one
